

### From gensets to renewable hybrid microgrids in Maluku

### Maryam M. Karimah, MEng.

### **Renewable Energy Technical Specialist, NZMATES**

Introduction

**Context and projects** 

**PV-Diesel Hybrid Microgrids** 

**Summary and lessons** 

### **NZMATES Introduction**

#### NZMATES (New Zealand – Maluku Access to Renewable Energy Support) main goal is to support the uptake of affordable, reliable, and renewable energy in Maluku Province

- 5-year technical assistance programme to support renewable energy
- Funded by New Zealand's Ministry of Foreign Affairs and Trade (NZ MFAT)
- Partnership Arrangement with Indonesia's Ministry of Energy and Mineral Resources and PLN (utility company) at national level
- Delivered by Infratec, with Yayasan Mercy Corps Indonesia (YMCI)
  - Infratec: NZ-based company EPC and Consultancy
  - MCI: 20 years experience in Maluku

**H** MER International **MICROGRID** Conference | 8<sup>th</sup> Annual | #HIMC2020

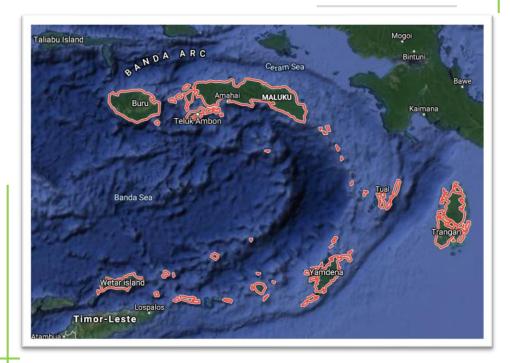

**Mercy Corps Indonesia** 

# **Context highlights**

### **Maluku Province**

- 1.7 million people, 1340 islands
- 120 inhabited islands with 1241 villages
- Electrification ratio reached 93.7% in August 2020
- There are over 300 diesel gensets installed in almost 100 grids, consuming >120 Million litres of diesel annually
- Grids range from 5 kW to 60 MW peak demand
- The cost of generation goes from 0.20 1.1
   USD/kWh

# **Project Information**

# PLN aims to hybridize existing diesel generators in Maluku Province to reduce fuel use and levelized cost of electricity

Location: 18 diesel-powered locations grouped in 3 geographic areas

Currrent LCOE: 0.4-0.96 USD/kWh

**Estimated Fuel Consumption:** 5.4 Million L/yr

Solar Irradiance: 4.45-5.44 kWh/m<sup>2</sup>/day\*

**Project Scope:** four technical options assessed per site

- PV grid-connected (no storage)
- Small PV Hybrid microgrid (<30% RE Fraction)
- Medium PV Hybrid microgrid (>50% RE Fraction)
- Large PV Hybrid microgrid (>80% RE Fraction)

# **System design considerations**

#### Load assumption builder

- Historical load data available for hundreds of diesel gensets
- Load converter to 24 hours operation (in some cases)
- Immediate and future load growth

#### **Cost curves developed**

Costs based on built projects and local costs

#### **Diesel fuel cost**

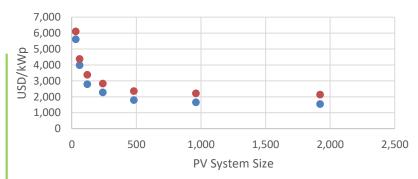

Fuel cost based on group location

#### Inputs are used to drive a PVSyst and HOMER study

Several options are modelled – different configurations and RE fraction

#### USD/kWp Installed PV Cost Curve

International Supply Modules USD/kWp 
Local Content Modules USD/kWp

### **HOMER Modelling**

Represent total specific energy yield in each location Total demand (kWh/day) in each location

### **Decision Criteria**

#### **Renewable energy fraction**

 Achieve 23% of RE penetration by 2025

### **LCOE and fuel consumption**

 Lower LCOE and fuel consumption is obtained

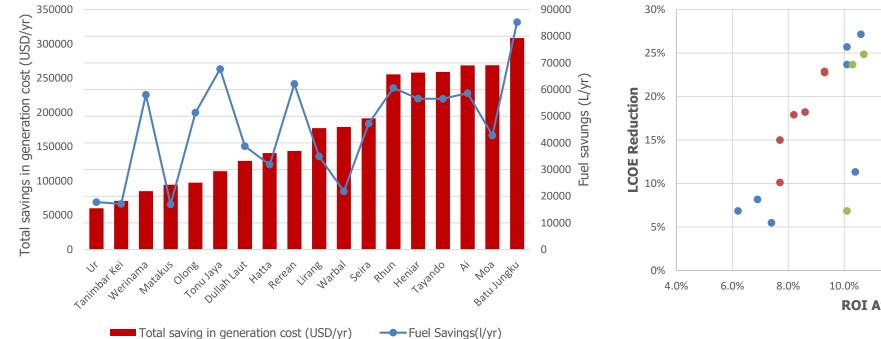

### **Return on Investment**

 Prioritize by the most significant value for money between projects due to capital limitation

### **Site Priority**

Savings in fuel and generation cost

25% y 20% 15% 15% 10% 5% 6.% 8.0% 10.% 12.0% 14.0% 16.0% 18.0% 20.% RI Avoided Cost

#### **ROI vs LCOE Reduction**

### **Site Priority**

### **Key Result Summary**

Parameter	Value					
PV Size	160 – 600 kWp					
RE Fraction	6 (grid connected)-91%					

Parameter	Value
NPC	1-34 Million USD
ROI	6-18%
LCOE	0.36 – 0.73 USD/kWh
LCOE Reduction	3-28%
Payback	5.6-8.7 years

## **Summary and lessons**

#### **Technical**

- For most sites, high RE fraction over 80% gives higher savings, although medium RE fraction is recommended for some systems >250 kW and on-grid for the largest system
- Larger demand with high RE fraction reduce significant fuel consumption
- Total PV capacity: 6.5 MWp from 18 locations
- CO2 avoided: 9,528 tonnes/year

#### **Economic**

- Fuel consumption reduction: 3,212,168 L/year
- Savings in generation cost: 797,667 USD/year
- LCOE of recommended system: 0.36-0.73 USD/kWh

### **Next Steps**

#### **Desk-Study and Planning**

- Detailed feasibility study for next year project implementation
- Incorporate hybrid solution into national electricity master plan as a strategy to achieve 23% Renewable Energy share

#### **Project Implementation**

- Developed typical technical specification for Hybrid Power Plants
- Next year project implementation will be dependent on COVID 19 situation.
- Build and start to construct Hybrid Power Plant in Pulau Tiga

#### **Capacity Development**

- A Microgrid Lab is being built in University of Pattimura to support training of new generation
- NZMATES has been working with PLN to form a renewable energy unit at the provincial level
